

# Menu Creator V

## How to install ?

In the zip file, you'll see a regular folder saying "Metro Menu UI", drag that folder anywhere (desktop, documents, somewhere memorable), then open the .exe file (keep the files in the folder, don't extract anything except the folder saying "Metro Menu UI". Once you've opened the .exe (should be called "Metro Menu.exe") you can go ahead and try some stuff out.

First thing you'll find is "File", "Help" and "Tools".

- "File" allows you to save the whole textbox (with all code) to somewhere as a .cs (CSharp) file), open the whole thing in Visual Studio (VS2013/2015 required, find all downloads and requirements below), then build the solution. Exit is self explanatory-
- "Help" is self explanatory, explore it and see everything included.
- "Tools" holds all the tools needed to create code. "Open UI Coding" allows for creating the submenus and standalone buttons and checkboxes. Lists not included yet. "Open Code Creator" is the standalone coding like invincibility, never wanted and blip stuff.
- Main Form holds the code you'll be using to build the menu.
